

## How to Fix Camera IR Reflection

---

The camera used in this demonstration is a CA120HL which is operating in complete darkness. In Picture 1 there is an object on the top right corner causing the IR lights to reflect too much light back into the camera; thereby causing a murky halo affect.

**Picture 1**

Once the object is removed or the field of view of the camera is adjusted, the picture is clear and the murky halo affect disappears.

**Picture 2**

If you are utilizing any type of IR illuminated camera and you are getting similar affects, make sure there is nothing causing an extreme amount of light within the camera's field of view to be reflected back to the camera.
